

Vigil

Markets Watch - Startup & Usage Guide

Project folder: /Users/tiagoferreira/Scanner Project

If you only do ONE thing: follow Section 1. It gives you real investment ideas in about 2 minutes and needs nothing except this project + Kronos. No OpenAI, no API key.

Section 0 - One-time setup (do this once)

1. Open the macOS Terminal app (press Cmd+Space, type Terminal, press Enter).
2. Go to the project folder. Copy-paste this exact line and press Enter:

```
cd "/Users/tiagoferreira/Scanner Project"
```

3. Install Vigil's Python packages:

```
python3 -m pip install -r requirements.txt
```

4. Check the Kronos forecaster is installed. Run:

```
ls ~/Kronos/model/kronos.py
```

- If it prints the path: you are done.
- If it says 'No such file': install Kronos once with the two lines below.

```
git clone https://github.com/shiyu-coder/Kronos.git ~/Kronos
python3 -m pip install -r ~/Kronos/requirements.txt
```

Your .env is already filled in (Gemini key + defaults). You do not need to edit anything to start.

Section 1 - Your first ideas in ~2 minutes (the fast test)

Scans the top US stock indexes using free Yahoo data. Most reliable way to confirm it works.

1. Make sure you are in the project folder (Section 0, step 2).
2. Run this single command (it wraps onto two lines here, but paste it as one):

```
python3 -m scanner.run "us" --asset-class index --offline --provider none --no-ui
```

3. Wait. The FIRST run downloads the Kronos model (~115 MB) - up to a couple of minutes, once only.
4. You should see lines like:

```
[1/6] Building universe for 'us'...
[2/6] Screening 4 candidates...
[4/6] Kronos forecasting 4 names (batched)...
Done. Watchlist: 4 names -> outputs/watchlist_....json
```

When you see 'Done. Watchlist: ...', it worked.

Other quick scans: replace "us" with "world", "europe", or "asia".

Section 2 - Open the app (to look at the ideas)

1. In Terminal, from the project folder, run:

```
python3 -m scanner.server
```

2. Your browser opens at <http://127.0.0.1:8080> (if not, open that address manually).
3. In the app you can:
 - Click a top-bar button (World / US / Europe / Asia / Crypto) to scan instantly.
 - Type an idea in the Directive box (e.g. AAPL MSFT NVDA) and click RUN SCAN.
 - Filter the left list by horizon: Low (day-trade-like), Med, High (long-term).
 - Click a name for Thesis, Why now, Performance metrics, forecast chart, trade levels.
4. Keep this Terminal window open while using the app - it is the engine.

Top-right dots show connections. A RED OpenAlice dot is normal - index and crypto scans do not need it.

Section 3 - Build a portfolio & get sell warnings

1. Open any idea, click the '+ Portfolio' button (top-right of the report).
 2. Click 'My portfolio' in the top bar to see holdings.
 3. Click 'Check for sell signals' - Vigil forecasts each holding and warns on negatives.
- Saved in portfolio.json and checked on every scan (HELD tag; negatives under Exit signals).

Section 4 - Phone alerts via Telegram (optional)

1. In Telegram, message @BotFather, send /newbot, copy the token.
2. Message your new bot once. Open the getUpdates URL below (paste your token) and copy the id number:

```
https://api.telegram.org/bot<TOKEN>/getUpdates
```

3. Open the .env file and fill in:

```
TELEGRAM_BOT_TOKEN=...token...
TELEGRAM_CHAT_ID=...id number...
SIGNAL_MARKETS=us,crypto,portfolio
```

4. Test it:

```
python3 -m scanner.signals
```

Section 5 - Full mode with OpenAlice (optional, advanced)

Only needed for real EQUITY fundamentals, news, macro, earnings, broker positions. Index/crypto work without it.

1. In a separate Terminal, start OpenAlice and leave it running:

```
cd ~/OpenAlice
pnpm install && pnpm build && pnpm dev
```

2. Set OPENALICE_MCP_URL in .env to the MCP port it prints.

Section 6 - Shutting everything down

1. The app: click its Terminal window and press Ctrl + C (or close the window).
2. If a forecaster was left running, run:

```
pkill -f "uvicorn kronos_service"
```

3. OpenAlice (if started): Ctrl + C in its window.

Nothing keeps running afterwards. Ideas stay in outputs/, portfolio in portfolio.json.

Section 7 - If something is not working

- command not found: python3

Fix: Install Python 3 from python.org, re-open Terminal, try again.

- No module named scanner / No such file or directory

Fix: Wrong folder. Run the Section 0 step 2 cd line first, exactly (with quotes).

- Kronos source not found / forecast errors

Fix: Kronos not installed. Do Section 0 step 4.

- It hangs on the first run

Fix: First run downloads the model (~115 MB). Give it 1-2 minutes; once only.

- The browser did not open

Fix: Open <http://127.0.0.1:8080> manually while scanner.server runs.

- OpenAlice dot is red

Fix: Fine for index/crypto. Only equity-fundamentals scans need OpenAlice (Section 5).

- A scan returns nothing / odd names

Fix: Run an index scan first (Section 1) to confirm the engine, then use exact tickers.

Cheat sheet

```
cd "/Users/tiagoferreira/Scanner Project"
python3 -m scanner.server
python3 -m scanner.run "us" --asset-class index --offline --no-ui
python3 -m scanner.signals
pkill -f "uvicorn kronos_service"
```
